

RUDOLF KREIBICH

CLOUD / PLATFORM / AGENT ENGINEERING & OPERATIONS

I enjoy helping agents manage dramas of computing machines

PRAGUE / CZECH REPUBLIC

01 EXPERIENCE & APPROACH

Since 2011, I have focused on removing human labour from the deployment, operation, and monitoring of software across cloud and on-premises infrastructure. Over the years I have worked in a range of technical and business roles within enterprise, startup, and public-sector organisations. The emergence of AI agents has brought me the great joy of harnessing efficiency gains while mitigating the risks of nondeterminism. I am now looking for opportunities where I can leverage my experience to develop agent-driven approaches to delivering and operating platforms in the cloud.

I am customer and delivery value oriented. I am happy to help you with platform delivery, team development and technical business infrastructure. I enjoy working as a hands-on engineer, team lead or in product development. I can bring my own approach or adapt and improve your strategy. I have learned and forgotten many technologies on my journey, but I am always open to finding and learning the best approach to the challenges ahead.

02 ROLES

DELIVERY LEADERSHIP

Build and operate platforms from initial architecture and prototyping, through delivery of automation, observability and reliability, to resilience, compliance and cost optimisation.

This includes managing vendors, roadmaps, deliverables, estimations, presentations and all the work related to the delivery.

TEAM LEADERSHIP

Develop and nurture an open, value-driven engineering culture striving for autonomy, ownership and collaboration as a foundation for the excellent delivery-oriented team.

I am used to working with cross-site teams across timezones stretching from California to India. I mitigate the silo mindset by establishing joint ventures with different teams to align on a common set of goals serving the customers.

PRODUCT OWNER

Delivery naturally feeds understanding of target consumer community, power users and stakeholders. User experience problems, missing capabilities and recurring issues create an opportunity to focus on valuable deliverables.

I act on these findings, assess the wider impact of the new features and develop a user-facing roadmap to continuously improve the value of the platform to users and stakeholders.

03

CAREER HIGHLIGHTS

Enterprise scale, startup velocity and public-service responsibility.

WAYPOINT TECH INC. / Startup

Feb 2026—Now

Owner of Agent-first DevOps & Cloud Engineering, Agent Operations

Waypoint was my ticket to experience agent-driven product delivery first-hand. I took over the CTO's Cloud & DevOps responsibilities and gradually embraced agent-driven approach to all aspects of my work. While providing evidence for the SOC 2 Audit I was exploring ways to automatically align our compliance via Vanta MCP just by developing merge request skills. I established Docker Sandbox to restrict agents' access to cloud credentials and as one of the agent sandboxes for product's dynamic pipeline capability. I scoped permissions for agents to perform routine root-cause analysis in Cloud, performed agent-driven migration of Production environments between hyperscalers and code bases. I used agents in E2B platform delivery, Terraform development and all other aspects of continuous delivery.

MSD, Czech Republic / Enterprise

Jun 2020—Jan 2026

ML Platform Engineer -> Data Science Platform Delivery Lead -> Data Science Platforms Product Line Architect

I was hired as Big Data Platform Engineer for Hadoop deployments in AWS. I started to work on in-house AWS native services based Machine Learning Platform and within the first year I became delivery lead of Data Science platform powered by Dataiku. I stood up a platform with my team from nothing to established Enterprise platform providing Data Science, Data Processing, Machine Learning and AI driven capabilities. By continuous improvement and efficient delivery, we spearheaded emerging enterprise enablers such as MCS 2.0 AWS Accounts, Kubernetes or Enterprise-aligned Terraform Modules. We delivered Karpenter powered scheduling and drove integration with the Enterprise Agent Platform.

As Product Line Architect I was responsible for technical evaluation and delivery of new capabilities. I delivered Code Ocean and Domino Data Science Platform for evaluation by Research Laboratories. Once Domino was chosen to power one of the Analytical components in new Clinical Pipeline, I worked closely with MRL & MRL IT to deliver a Business Critical System with my team. In collaboration with AI Compliance and DevSecOps teams, we provided a Hugging Face model ingestion gateway, enabling scanning of models and storing them in Artifactory. We exposed onboarded models to community via Enterprise AI asset catalog. Meanwhile I was driving engagement with Enterprise Architecture to integrate our product line with emerging Agentic Platform.

ANGELCAM, INC. / Startup

Oct 2017—May 2020

Owner of Cloud Engineering & Operations, DevOps

My responsibility was maintaining and improving operations, documentation, deployments, monitoring and security of services deployed across different infrastructure providers. Angelcam is operating Cloud Recording, Streaming, Broadcasting services integrated with IoT sensors to provide real time security service for customers via mobile and web based interfaces. I ran our operation across AWS, Digital Ocean and multiple bare-metal providers.

Among initial deliverables was containerisation of Rust and Python-based services, their continuous delivery and autoscaling in Docker Swarm. I moved observability and alerting to Prometheus and exposed metrics to the team with Grafana. A big part of job was building trust with the customers as it depended on reliable connectivity to AWS. In security market each downtime in recording might be reason for canceling subscription. I made sure uptime of different services was not just high but also transparent and publicly observable

NATIONAL LIBRARY OF THE CZECH REPUBLIC

Feb 2011—Sep 2017

Owner of Web Archiving Operation -> Head of Application Support

My job was to deliver and continuously improve web archiving services for The National Library. Early in my career I had opportunity to participate at staff exchange in Internet Archive at San Francisco. Among other things, this helped me understand configuration implications and behaviour of their archival crawler and kick-started my knowledge about way the huge amount of data are stored and processed in a meaningful way. I designed and implemented recurrent Czech domain and topical crawls. I nourished couple on-premise storage servers with new hard drives including couple Raid 6 resurrections. I was operating archival retrieval service, our Web Archive websites and couple other services, research projects and prototypes in vSphere or bare metal. Before I left I took responsibility over Application Services Department as I wanted drive technical collaboration inside library and across Czech and Foreign Libraries.

TECHNOLOGY HIGHLIGHTS

04

AWS / Since 2017

Bedrock, EKS, ECS, S3, IAM, SageMaker, Glue, Step Functions, EC2s, ALBs, NLBs, ASGs, VPCs, Route 53, CloudFormations, CloudWatch, Secrets Manager, Organizations, Accelerator, DynamoDB, RDS, ElastiCache, etc.

Azure / Since 2026

Bicep, Foundry, VMs, Front Door, Azure Container Apps

Continuous Delivery

- Terraform & Terragrunt, Ansible
- Docker Compose, Docker Swarm, Kubernetes
- Vagrant, vSphere
- Bitbucket, GitHub, GitLab, Jenkins

Observability & Alerting

Prometheus, Grafana, Loki, Sentry, Elasticsearch, PagerDuty, Zabbix etc.

Data & Data Science Platforms

Dataiku, Databricks, Domino Data Lab, Code Ocean

Agent Platforms, Sandboxes & Tooling

E2B, Docker Sandbox, Azure Container Apps, Claude, Codex, Copilot, Bifrost

Scripting

Bash, Python

Compliance

Vanta

Linux Systems

Gentoo, Fedora, CentOS, Red Hat, Debian, Ubuntu, Alpine, SUSE.

05

SIDE QUESTS

There is always more work to do.

DARK CIVILISATIONS / Computer Game

Dec 2025—Now

Dark Factory Development in Rust & Bevy

My studying of the human civilisation and playing of the games formed my ideas on approaching Civilisation genre. With recent improvement of LLMs and agentic tools I was able to deliver prototype components beyond my programming, academic and mathematical skills. I embrace Dark factory approach and focus on iterative specification of game systems and developing visual appeal. To help agents in resolving technical issues, I usually instruct agents to conceptualise simulation and computations for me. This greatly simplified navigating technical decisions affecting performance and behaviour of the simulation. Driving artistic aspects of the game such as music and art is way more tricky, but I am slowly getting better at adopting what generative AI can do well.

This project helps me greatly in assessing capabilities of frontier models and their quirks. I found it very efficient to dedicate a server to the agents and interact with them remotely. Without recent rise of AI capabilities I would never be able to make any meaningful progress as a salary man.

DevOps, Cloud Engineering / Contracting

Oct 2017— Jan 2025

On-demand Delivery

Before my daughter was born, I used my free time for contracting. My clients were my ex-employers and I worked on project-basis.

GAME TECHNOLOGIES

06

Main Programming Languages & Frameworks

Rust, Bevy Engine, wgpu (Metal, Vulkan, DirectX), Python, Streamlit.

AI Tools

Codex, Claude, Stable Diffusion (local)

Target Platforms

Apple Silicon, Windows & Linux (x86 & ARM)

07

EDUCATION,
LANGUAGES
& INTERESTS

EDUCATION

CHARLES UNIVERSITY

B.A. Information Science & Librarianship
New Media Studies / Discontinued
before thesis

MASARYK UNIVERSITY

Audiovisual Culture / Discontinued
